2)Amazon Home Screen UX Redesign

Project Overview

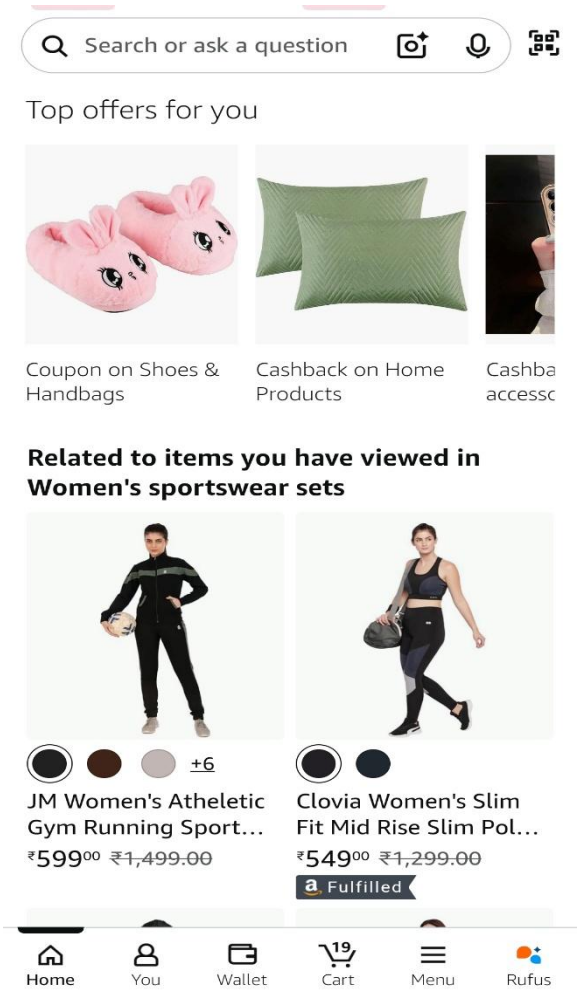
This project is a redesign of the Amazon mobile app home screen. The goal of the redesign was to improve the user experience by reducing visual clutter, improving content hierarchy, and making product discovery easier for users.

Project Overview

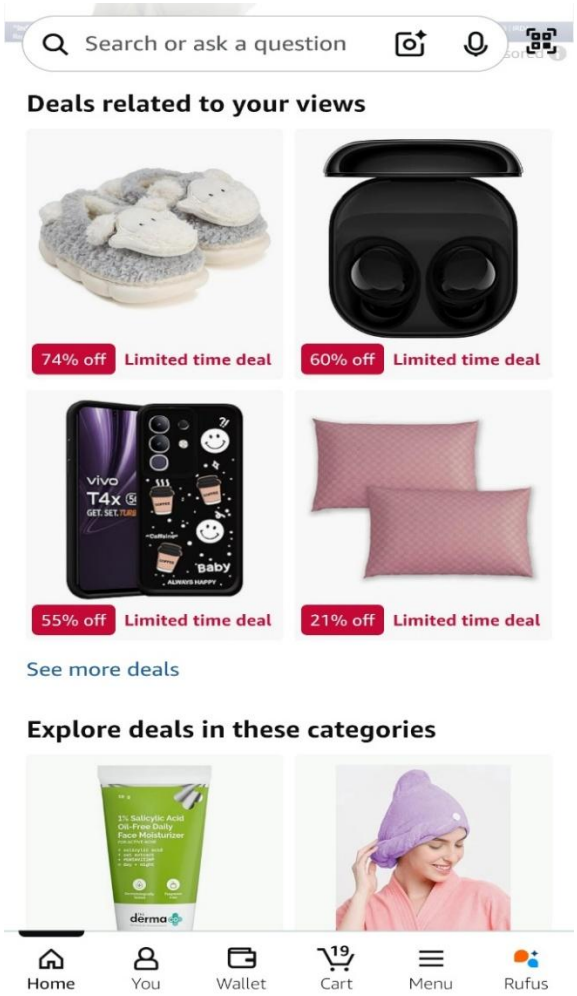
This project is a redesign of the Amazon mobile app home screen. The goal of the redesign was to improve the user experience by reducing visual clutter, improving content hierarchy, and making product discovery easier for users.

Problem Statement

The current home screen contains multiple large banners and repeated recommendation sections, which creates visual clutter and pushes important content below the fold.



Users may need to scroll a lot to find relevant products, which can reduce engagement and make the shopping experience less efficient.



Goals:

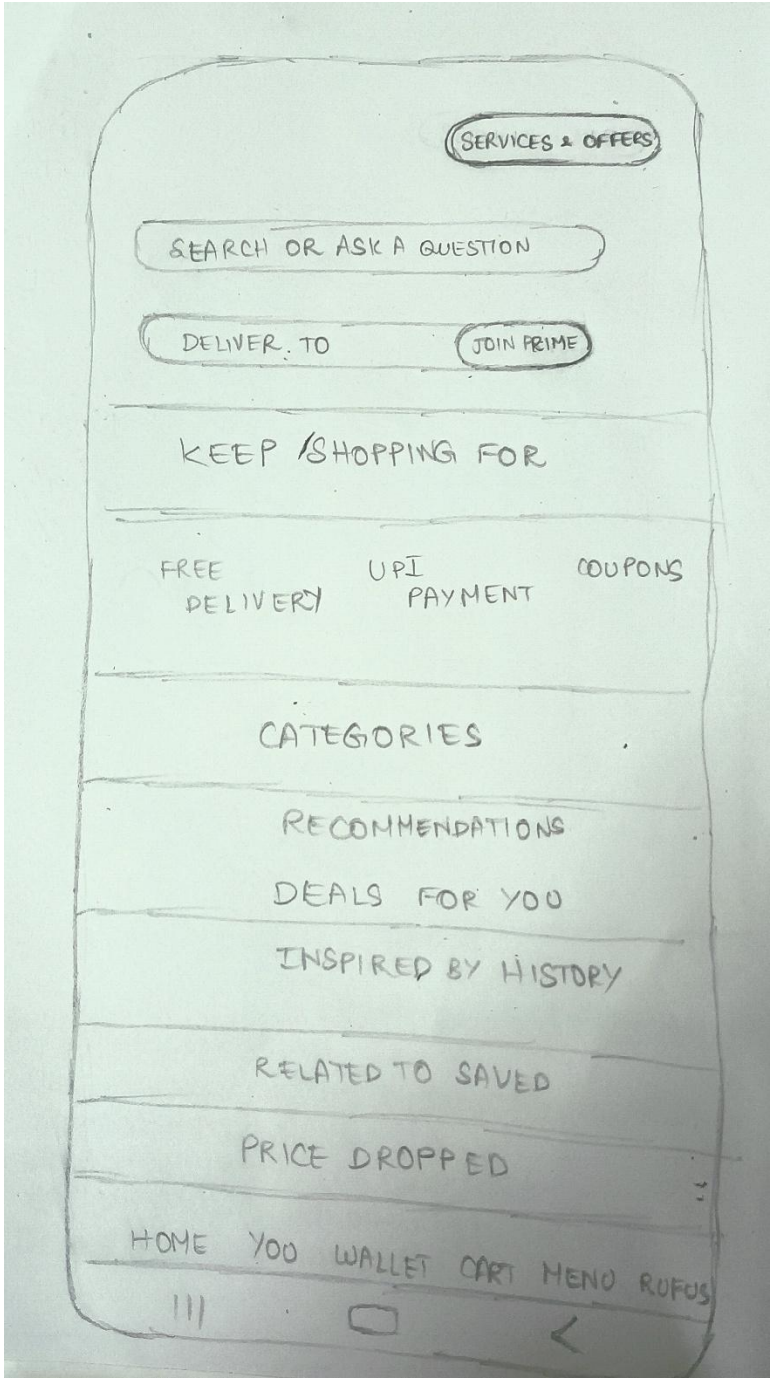
The main goals of this redesign were:

- Reduce visual clutter
- Improve visual hierarchy
- Reduce excessive scrolling
- Improve product discovery

- Make offers and deals easily accessible
- Organize recommendation sections based on user intent

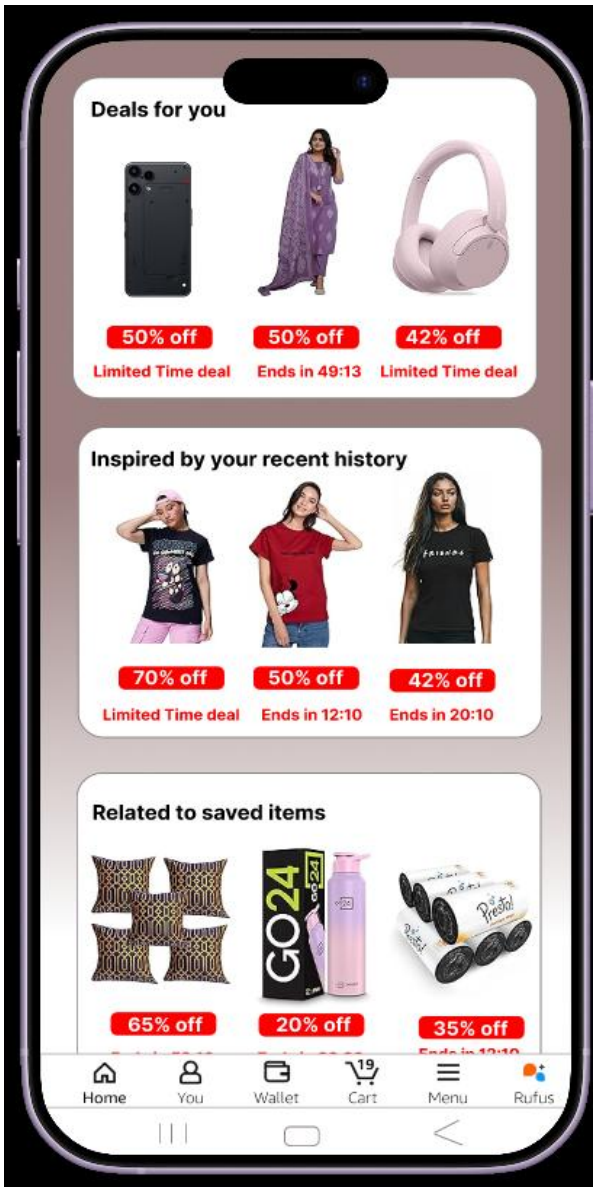
Wireframing

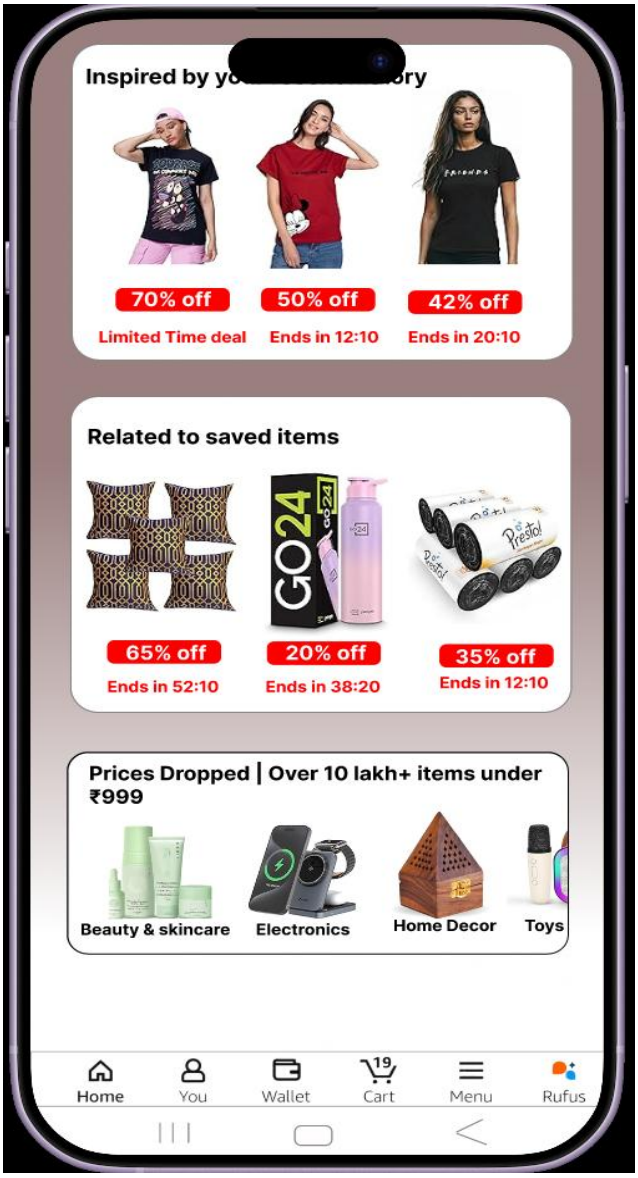
Before starting the UI design, low-fidelity wireframes were created on paper to explore different layout ideas and decide content hierarchy. This helped in planning the structure before moving to high-fidelity design.



Final Redesign

- The home screen was redesigned using a cleaner card-based layout, improved spacing system, and better content organization. The redesign focuses on simplifying the interface while keeping important features easily accessible.





Key Improvements Made

The following improvements were made in the redesign:

- Reduced large banners and replaced them with a compact offers section
- Maintained three recommendation sections targeting different user intents
- Improved spacing and alignment using a consistent spacing system
- Used horizontal scrolling for deals to reduce vertical scrolling
- Added clear section separation using cards
- Improved accessibility of offers and deals

- Designed a cleaner top section with separate delivery and search cards
- Reduced visual clutter by organizing content into structured sections

8. Recommendation Sections – UX Thinking

Instead of merging all recommendation sections into one, three separate sections were maintained because each section targets a different user intent level.

- **Continue Shopping:** Helps users quickly return to products they previously viewed, reducing user effort.
- **Deals For You:** Targets users who are motivated by discounts and special offers, encouraging faster purchase decisions.
- **Related To Saved Items:** Targets users with high purchase intent and suggests complementary products, encouraging add-on purchases and increasing cart value.

Each recommendation section was designed to target a different stage of user purchase intent — browsing, considering, and purchasing — to improve overall user engagement and conversion rates.

9. Design System Used

To maintain consistency, the following design system was used:

- 8px spacing system
- Consistent card layout
- Rounded corner cards
- Limited color palette
- Light shadows for elevation
- Consistent typography hierarchy

10. Tools Used

- Figma (UI Design)
- Auto Layout (Layout system)
- Prototyping (Interactions)

- Wireframing (Paper sketches)
